Styling and Assets in Next.js

How Next.js handel the assests and the
styling

+ Follow

Introduction to Styling in Next.js

Next.js supports different ways of styling your application, including:

- **CSS Modules**
- **Global CSS**
- **Tailwind CSS**
- **Sass**
- **CSS-in-JS**

[+ Follow](#)

CSS Modules & Global

CSS Modules: Create locally scoped CSS classes to avoid naming conflicts and improve maintainability.

Global CSS: Simple to use and familiar for those experienced with traditional CSS, but can lead to larger CSS bundles and difficulty managing styles as the application grows.

```
// Button.module.css
.button {
  background-color: #4caf50;
  color: white;
  padding: 10px 20px;
  border: none;
  border-radius: 5px;
  cursor: pointer;
}

// Button.js
import styles from './Button.module.css';

export default function Button() {
  return <button className={styles.button}>Click Me</button>
}
```

```
/* styles/globals.css */
body {
  font-family: Arial, sans-serif;
  margin: 0;
  padding: 0;
  background-color: #f5f5f5;
}

h1 {
  color: #333;
}
```

CSS-in-JS

CSS-in-JS: Embed CSS directly in your JavaScript components, enabling dynamic and scoped styling. The following **libraries** are supported in Client Components in the app directory:

- **vchakra-ui**
- **kuma-ui**
- **@mui/material**
- **@mui/joy**
- **pandacss**
- **styled-jsx**
- **styled-components, etc...**

Tailwind CSS Integration

Tailwind CSS: is a utility-first CSS framework that works exceptionally well with Next.js, to integrate tailwind you should follow this steps

- **Installing Tailwind**

```
npm install -D tailwindcss postcss autoprefixer  
npx tailwindcss init -p
```

- **Configuring Tailwind**

Inside your Tailwind configuration file, add paths to the files that will use Tailwind class names:

- **Importing Styles**

Add the Tailwind CSS directives that Tailwind will use to inject its generated styles to a Global Stylesheet in your application.

```
@tailwind base;  
@tailwind components;  
@tailwind utilities;
```

SASS Integration

Next.js has built-in support for integrating with **Sass** after the package is installed using both the **.scss** and **.sass** extensions. You can use component-level Sass via CSS Modules and the **.module.scss** or **.module.sass** extension.

- **First, install it:**

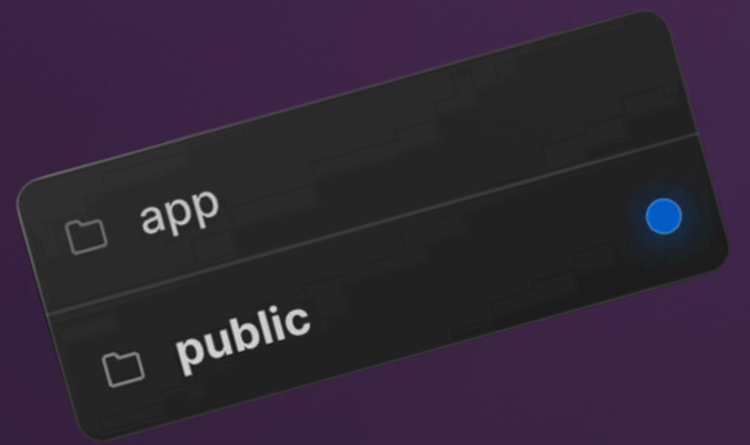

```
npm install --save-dev sass
```

Managing **Assets** in Next.js

- **Static File Serving**

Place images, fonts, or other assets in the public/ directory.

Access them with paths like `/images/example.jpg`.

- **Image Optimization:**

Use the `<Image>` component for responsive, optimized images.

Features include lazy loading, automatic resizing, and support for modern formats like WebP.

Fonts in Next.js

next/font Optimization: This module allows you to use **Google Fonts** and local fonts with automatic optimizations. Fonts are downloaded at build time and served with your static assets, eliminating external network requests and reducing layout shifts by leveraging the size-adjust property.

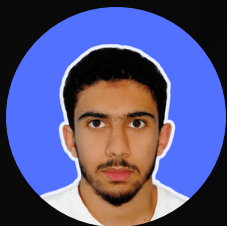

```
import { Geist } from 'next/font/google'

const geist = Geist({
  subsets: ['latin'],
})

export default function RootLayout({
  children,
}: {
  children: React.ReactNode
}) {
  return (
    <html lang="en" className={geist.className}>
      <body>{children}</body>
    </html>
  )
}
```
