

What is Time Complexity

As a developer

you are always looking for ways to optimize your code and make your app run faster

But have you ever stopped to think about the time complexity of your code?

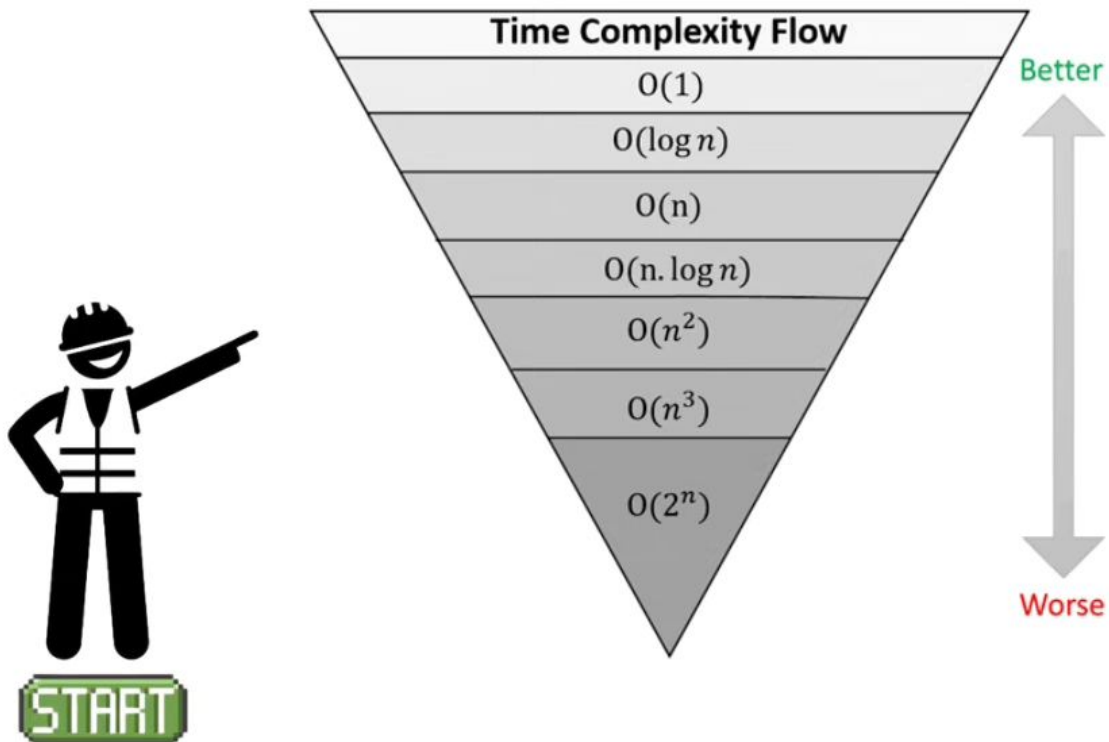

Adding more tasks will not help me now

Ignore

The time complexity of an algorithm

Is a measure of how long it'll take to execute depending on the size of the data set

So how can you be sure that your code runs as fast as possible?

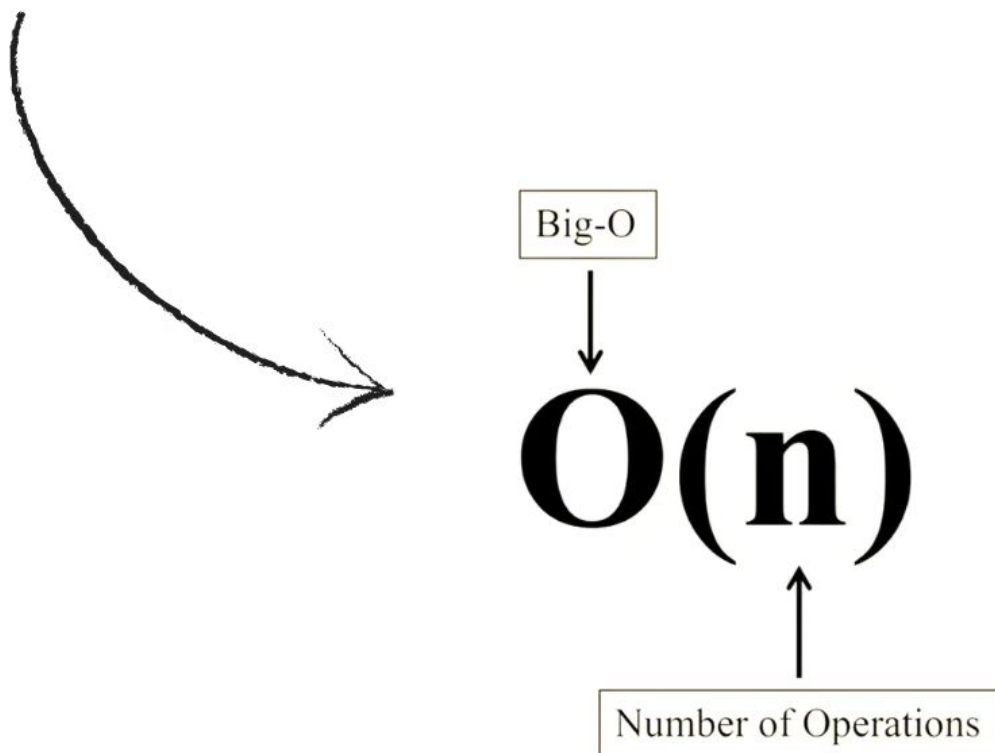

Cancel

By understanding and optimizing for its time complexity?

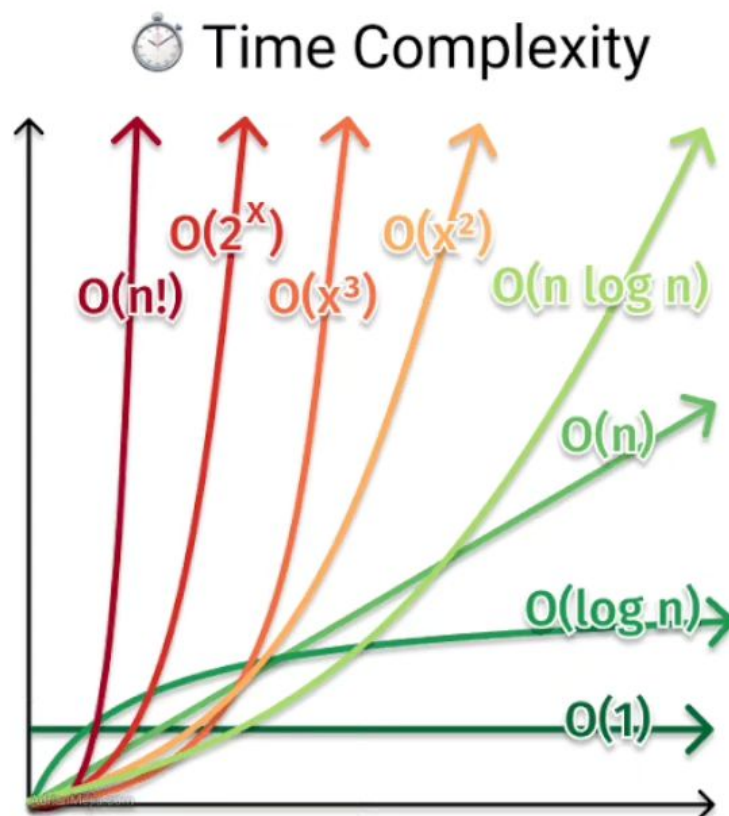

Big-O Notation

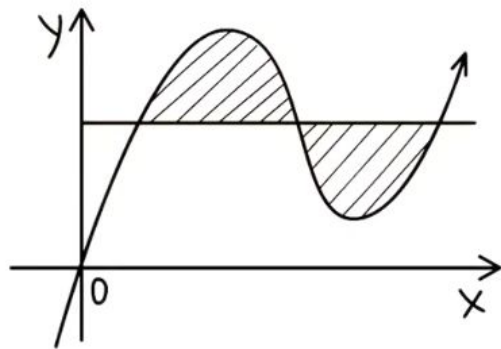

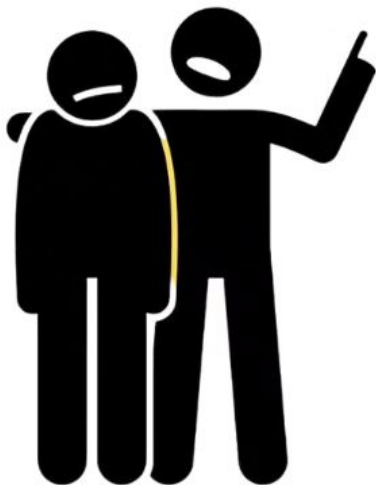

It is a way of expressing the runtime of an algorithm in terms of its worst-case performance

There are many different time complexities that you need to be aware of, but here are some of the most common:

Time complexity can be critical for developers when they are trying to choose an algorithm to use for a particular task

Some algorithms may be faster but require more memory, while others may be slower but use less memory

It's important to choose an algorithm that will fit the needs of your app and your user base
