

Say Goodbye to Pagination!

Master Infinite Scroll in JavaScript with
just a few lines of code.

By - Madhav Kabra

01

Trigger Scroll Detection

```
window.addEventListener('scroll', () => {  
  if (window.innerHeight + window.scrollY >= document.body.offsetHeight) {  
    loadMoreData();  
  }  
});
```

Detect when the user reaches the bottom of the page.

swipe

02

Simulate Data Fetching

```
function loadMoreData() {  
  console.log('Fetching more content...');  
  // Simulate fetch & append data  
}
```

First, we need a simple HTML structure with a content container.

swipe

03

Simulate Data Fetching

```
function loadMoreData() {  
  console.log('Fetching more content...');  
  // Simulate fetch & append data  
}
```

Trigger your data fetch logic when scroll is detected.

swipe

04

Add Loading Indicator

```
<div id="loading">Loading...</div>
```

Give users feedback while content loads.

swipe

05

Append New Content

```
function appendData(data) {  
  const container = document.getElementById('content');  
  container.innerHTML += data;  
}
```

Dynamically insert new content into the DOM.

swipe

06

Debounce for Performance

```
let debounce;  
window.addEventListener('scroll', () => {  
  clearTimeout(debounce);  
  debounce = setTimeout(checkScroll, 200);  
});
```

Optimize scroll performance with debouncing.

swipe

That's It!

**You just built Infinite Scroll in
JavaScript!**

**No libraries. No fluff. Just clean,
functional code.**
