MUST-KNOW REACT COMPONENT PATTERNS

@vinithkumarchandrasekaran

01

PRESENTATIONAL VS CONTAINER COMPONENTS

Presentational: Focuses only on UI. No logic
Container: Handles logic and state

```
// Presentational
const UserCard = ({ name }) => <p>{name}</p>;

// Container
const UserContainer = () => {
  const name = useUserName();
  return <UserCard name={name} />;
};
```

02

HIGHER-ORDER COMPONENTS (HOC)

Function that takes a component and returns an enhanced one.

Great for code reuse (auth, loading, etc).

```
function withAuth(Component) {  
  return function AuthWrapper(props) {  
    const isAuthenticated = useAuth();  
    return isAuthenticated ? <Component {...props} /> : <Login />;  
  };  
}
```

03

RENDER PROPS

A component that uses a function as a child to share logic.
Useful for sharing behavior between components.

```
<Mouse>  
|  {(position) => <p>X: {position.x}</p>}  
</Mouse>
```

04

COMPOUND COMPONENTS

Components designed to work together using shared context.

Provides a declarative API for users

```
<Tabs>  
  <Tabs.Tab label="A" />  
  <Tabs.Tab label="B" />  
  <Tabs.Panel>A content</Tabs.Panel>  
</Tabs>
```

05

COMPOUND COMPONENTS

Components designed to work together using shared context.

Provides a declarative API for users

```
<Tabs>  
  <Tabs.Tab label="A" />  
  <Tabs.Tab label="B" />  
  <Tabs.Panel>A content</Tabs.Panel>  
</Tabs>
```
